Patch Release Date: 7-30-2002
Build: 4.2.7.24

NEW FEATURES:

MeetingPlace Directory Services support for ODBC metalink.

BUG FIXES:

CR17736: Deleting ODBC Metalink error - Deleting an ODBC metalink does not occur properly. The metalink is not removed cleanly, and prevents the user from re-adding the ODBC metalink.

CR17737: Deleting 13000 profiles in MeetingPlace Directory Services does not work - Manually deleting 13,000 profiles using ldapmodify, Expected the deletions to propagate to MeetingPlace Server, after 24 hours the profiles still existed in MeetingPlace Server.

KNOWN ISSUES:

CR18047: Multiple ODBC Metalinks to corporate directories causes metalinks to stop - After Connecting 3 ODBC metalinks from same MeetingPlace Directory Services server to one SQL server, when restarting the service, one of the ODBC metalinks worked, stopping the service and restarting a second time, caused the second metalink to start and the same thing on the third. The metalinks would not work all at the same time until restarting the service for each link. This is and will not be a common practice with corporate directories. This issue is being monitored.

CR18099: No documentation for ODBC.

CR18100: Currently we do not include applicable .cfg and .mmu for ODBC in the DSG Admin folder.

CR18101: The "DSG Admin" tool is missing the ODBC selection. On the current dialog, the ODBC selection is grayed out not allowing selection. All ODBC metalinks need to be run from a command line.
