

Cisco Security Planning and Design Service

A ROBUST SECURITY SOLUTION DEPLOYED QUICKLY AND COST EFFECTIVELY

A Network That Supports Your Goals

Cisco brings together technologies that enable employees, customers, and partners to securely access mission-critical services and applications and take advantage of new business models. But, supporting new business models that foster broader collaboration and greater productivity requires an organization to balance business transformation with the protection of network access and assets, while also making sure of availability and supporting regulatory compliance.

Cisco SecureX™ is a context-aware, network-centric approach to security that enables organizations to embrace the new network security landscape while protecting business assets, critical services, and employees. Central to protecting the network from security intrusions is a comprehensive security solution. Integrated, dynamic security controls protect the network infrastructure against ever changing threats and vulnerabilities, while also supporting alignment with evolving security policy and compliance requirements.

The Cisco Security Planning and Design Service

Building a robust security defense for your organization's network begins with a clear understanding of the current vulnerability state of your network, applications, systems, and network-connected devices. Designing and deploying a multilayer defense solution require more than in-depth knowledge of security products and leading practices; it also requires extensive knowledge of the network infrastructure that supports the security solutions.

Security Technology Readiness Assessment

By assessing your requirements and current network state early in the planning process, Cisco can identify gaps and recommend changes to your network infrastructure that will improve the effectiveness of your Cisco security solution, reduce deployment costs and duration, and allow for smooth solution integration.

Security Design Development

Your custom security design will reflect recommendations made as part of technology readiness assessment and represent the best use of available Cisco security technology features to meet your requirements and to most effectively protect your business. An effective security design helps your organization to better protect business assets and services, to more cost-effectively deploy new security solutions, and to avoid costly delays and disruptions during implementation.

Security Implementation Engineering

Improve deployment efficiency, accuracy, and success with support from Cisco security engineers using an in-depth, detailed implementation process based on leading practices. Cisco security engineers guide and assist your team before, during, and after deployment.

Security Knowledge Transfer

Prepare your staff to effectively operate, optimize, maintain, and manage your Cisco security solution with formal and informal training and ongoing consultation.

The Cisco® Security Planning and Design Service helps you develop and implement an effective yet flexible solution with four activities that Cisco security experts have identified as essential for successful security deployments:

- Security technology readiness assessment: Reviews your security policies, assesses your network, and identifies business requirements to prepare for the design of a network security solution that aligns with your business objectives.
- Security design development: Develops the security design and documents the solution architecture with detailed designs and system test plans.
- Security implementation engineering: Improves and supports deployment success. You receive support before, during, and after implementation.
- Security knowledge transfer: Instills in your staff the knowledge and skills to operate, optimize, maintain, and manage your enhanced security solution.

Why Cisco Services

Realize the full business value of your technology investments more quickly with intelligent, personalized services from Cisco and our partners. Backed by deep networking expertise and a broad ecosystem of partners, Cisco Services enable you to successfully plan, build, and run your network as a powerful business platform. Whether you are looking to seize new opportunities, to meet rising customer expectations, to improve operational efficiency, to lower costs, mitigate risk, or accelerate growth, we have a service that can help you.

Availability and Ordering

The Cisco Security Planning and Design Service is available globally and can be purchased from Cisco and Cisco certified partners. Service delivery details might vary by region.
